

git clone <https://github.com/bunty4200/Udemy-hello-world.git>

<https://github.com/bunty4200/Udemy-hello-world.git>

Update the index.jsp file and push into git hub again try to build the code

After that use Poll SCM.

I don't want to do execute my jenkins job manually whenever there is some change in GitHub it 'will automatically identify and execute the job.

POLL SCM work as cronjob.

Whenever developer commit their changes into GitHub poll scm will going into GitHub and check the code in particular time interval is there any changes in the code then it will automatically trigger the job so poll scm pull the code build the code test it and notify and deploy the latest code into tomcat server.

So, we need change code only developer side push on GitHub then poll scm automatically build you job
